

NOVERA — Screening Report

Hussain · generated 28 Jul 2026, 01:21

Biomarker readings

Biomarker	Value	Reference
pH	6.8	6.2–7.6
Creatinine	1.0 mg/dL	0.6–1.3 mg/dL
Urea	16.0 mg/dL	7.0–20.0 mg/dL
Temperature	36.8 °C	36.1–37.2 °C

Health area analysis

Health area	Status	Severity	Key finding
Kidney Health	normal	0	Creatinine and urea levels are within the optimal reference range.
Hydration	watch	3	Low water intake combined with high daily exercise may impact your hydration status.
Oral Health	normal	0	Salivary pH is within the healthy physiological range.
Digestive Health	normal	0	All measured biomarkers indicate stable digestive and metabolic indicators.

What this means

Your kidneys are doing great—creatinine and urea are right where they should be, and your digestive system looks stable as well. Your oral health is also in good shape, with a healthy saliva pH.

The only area that needs a bit of attention is hydration. You're drinking less water than recommended, and you're also exercising a lot each day. Those two together can make it harder for your body to stay balanced, especially when you're sweating a lot.

Since staying well-hydrated supports both your kidneys and your digestion, a small increase in water intake—perhaps a glass every few hours—will help keep everything running smoothly. Keep up the good work with exercise, and just add a bit more water to your routine.

Your self-care plan

****Personal Self-Care Plan – Hussain (28 yrs)****

****Today****

- **Hydrate before coffee:**** Drink 250 ml of water 10 min before your morning coffee.
- **Mid-day water goal:**** Carry a 500 ml bottle and aim to finish it by 2 pm.

****This Week****

- **Exercise hydration:**** Sip 200 ml of water every 30 min during your 2-hour workout (use a sports bottle).
- **Post-coffee refill:**** Replace one cup of coffee with a “coffee-with-water” (coffee + 250 ml water).
- **Track intake:**** Log each water sip in a simple notebook or phone app; aim for 2.5–3 L total daily.

****Retest****

Schedule your next hydration check in ****4 weeks**** (or sooner if you notice dizziness, dark urine, or increased

thirst).

****Maintenance Tips****

- Keep a reusable bottle at work and home.
- If you feel thirsty, drink 250 ml immediately—thirst is a late signal.
- Continue moderate carbs and limit added sugars; they help maintain energy for your long sessions.

Stay consistent, and you'll notice clearer energy and better recovery from your daily exercise.
